

ALPINE

innovative cutting solutions

HYDRAULIC ROTARY CUTTERS

Within the ALPINE Group, roadheading machines featuring cutting heads for use in mining and tunneling have been built for more than thirty years. Our experience in the rock cutting business is unmatched. Now, ALPINE is pleased to offer a new line of hydraulic rotary cutters. Powerful, efficient and highly reliable, ALPINE cutting heads have already earned an excellent reputation. The product range includes five types of transverse cutting units featuring hydraulic drive powers from 24 hp to 160 hp. This comprehensive range offers cutting solutions for a multitude of on-site requirements and is suitable for the largest attachment carriers right down to mini excavators.

ALPINE cutting units can be equipped with a range of hydraulic motors, cutting heads, and picks (teeth) allowing flexible adjustment to individual operating conditions.

ALPINE fully supports its customers with project level consulting to ensure that the most suitable cutting units are selected to achieve maximum production at the lowest cost.

CUTTER BUCKET COMBINATION

Most recently, ALPINE has launched an exciting and innovative range of Cutter-Bucket Combination attachments. This multifunctional tool combines a Hydraulic Cutting Unit with a bucket system and is capable of excavating, cutting and crushing in one operation on-site. Besides keeping vibration to a minimum and guiding the cutter accurately, the bucket makes it possible for the excavated material to be immediately crushed and re-used on the construction site. A major advantage is that no attachment change is necessary. The result is significant savings in terms of time, material transport and waste disposal.

TYPICAL APPLICATIONS

- Trenching / Pipelines
- Quarrying
- Mining
- Scaling/Profiling
- Submerged Cutting
- Tunneling
- Asphalt Cutting/Roads
- Demolition
- Soil Mixing
- Stump Removal
- Concrete Grinding
- Cutting Frozen Ground
